

SPECIAL EVENT MONITORING

A high profile special event brings together an almost unlimited quantity of risk elements that can be of serious concern to the jurisdiction hosting it. Stakeholders who are tasked with ensuring the event's ultimate success must manage or respond to, in real time, all the factors that could impact that success. They can do so only if they have a unified 360° situational awareness of the activities, infrastructure, incidents, and threats that are occurring throughout the duration of the event.

Digital Sandbox provides the public safety community with that 360° awareness of their risk environment so that all constituencies — police, fire, rescue, emergency management, homeland security — can actively monitor any emerging threat and risk situations as they are occurring, through a unified view.

360° Situational Awareness of CIKR, Timeline, Threats, and Incidents

Digital Sandbox's Risk Analysis Center (RAC) Special Events solution provides its users with an unparalleled understanding of all the risk elements associated with a high-profile special event, through detailed visual displays built on comprehensive critical infrastructure and risk data.

The RAC's mobile applications provide users in the field the same view, and access to data, that is presented in the command center:

- CIKR that is impacted by the event
- Local jurisdictions' calls for service
- Suspicious Activity Reports (SARs)
- Prioritized news items that could have negative impacts
- Emergency vehicle locations
- High-priority CIKR
- Planned event-specific activities
- Unplanned event-specific activities, manually entered
- Intel converted into "incidents of concern"

The RAC Special Events Application

The RAC Special Events function is a fully-integrated suite of applications that present and apply incoming data in multiple forms, in real time, leveraging the collection of asset, threat, hazard, and risk data collected within the RAC.

- **Mobile Applications:** The RAC Monitor, RAC Indicator, and RAC Threat Monitor provide immediate access to existing RAC information for field personnel.
- **Defined Events:** Activities and Events that are related to the Special Event can be entered into the RAC and linked to critical assets.
- **Dynamic, Interactive Event Timeline:** Displays all the special-event related activities scheduled throughout the critical period, including unplanned events.
- **Threat Monitor:** Constantly updating, prioritized information from multiple data feeds (RSS, Calls for Service, SARs), which is visually differentiated for immediate recognition.

The RAC Special Events solution can be added to the Risk Analysis Center platform. It can serve as a stand-alone application or build on to an existing RAC subscription.
